Introduction

The ALiCS is the Alphadecimal Library Classification System (ALiCS), which is a system devised by the author to classify the books in his small home library. The name comes from the fact that the classes are composed of a mixture of letters and decimal numbers, the decimal part functioning in a similar way to other decimal classification schemes. The system is, in fact, loosely based on the [Free Decimal Correspondence](#) (FDC), devised by John Mark Ockerbloom, and the Melvil Decimal System as used by the online library cataloguing web site [LibraryThing](#).

Outline of the ALiCS

Books on the shelves of a library are identified by codes, called call numbers, which determine the order in which the books are arranged on the shelf. They aid in finding a required book based in its subject and keep books with the same or similar subjects together. In ALiCS, the call number comprises two parts: 1) a class mark, based in the main subject area or areas of the book, and 2) a book mark, usually based on additional information such as the title of the book or the author's surname.

The Class Mark

The class mark comprises two letters, called respectively the main class and the sub-class, and three numbers, which determine the subject of the book. Additionally, one decimal digit may sometimes be added, following a decimal point, to determine categories of specificity that will be specified further in the book mark. Thus, every class mark comprises five characters or five characters plus a decimal point and a further digit. On two-line labels the class mark appears on first line.

The Book Mark

The book mark comprises additional information to help identify the book within the class determined by the class mark. This is most often achieved using cutter numbers. Cutter numbers comprise a single letter followed by one or more digits, and are named after Charles Ammi Cutter, who devised them as part of his Expansive Classification scheme. The first cutter number following the class mark is preceded by a decimal point, and the numbers are arranged decimally, i.e. .A625 comes before .A65 which comes before .A7.

Cutter numbers are a useful device because they allow for books to be arranged alphabetically within a class according to, say, author's surnames or some other, appropriate category of information. There is usually at least one Cutter number in the book mark, and the information that this represents is determined by the class of the book. For example, a book in the English fiction class, "**BE113**", would have the first Cutter number representing the surname of the author, e.g. "**BE113 .H3**" for the author with the surname "Harris". For most works of fiction a second cutter number is usually added to represent the title of the book, e.g. "**BE113 .H3 I4**" for the book "Imperium" by Robert Harris.

In other cases there may be only an author cutter or a title cutter, or a cutter representing some other information. For example, in the class "**XL543**", library classification systems, the first cutter number represents the library classification system in question, e.g. "**.L5**" for "Library of Congress".

The Main Classes

There are 12 main classes, which are as shown in the list below:
